ProActive

Automate business processes and workflow without modifying existing core business systems

" ProActive allowed us to implement best practice and automate procedures while keeping our Enterprise solution vanilla. We streamlined processes and reduced manual error. "

Uti400

The easy way to improve business processes

ProActive allows users to implement an intelligent approach to work flow automation. This provides increased enterprise functionality without modification to the existing system.

- Monitor changes to any field within any IBM i database
- Trigger events depending upon the change that has occurred
- Create an audit log of file changes
- Run SQL statements
- Execute programs passing parameter from the before and after image

Run your enterprise solution the way your business requires WITHOUT customising the core application. ProActive provides powerful functionality that allows your enterprise to improve efficiency and reduce error.

Create work flows to suit best practice or bespoke processes. The rules engine will allow you to apply logic to events to trigger/launch depending upon values and variables.

Uti400

An intelligent approach to workflow automation
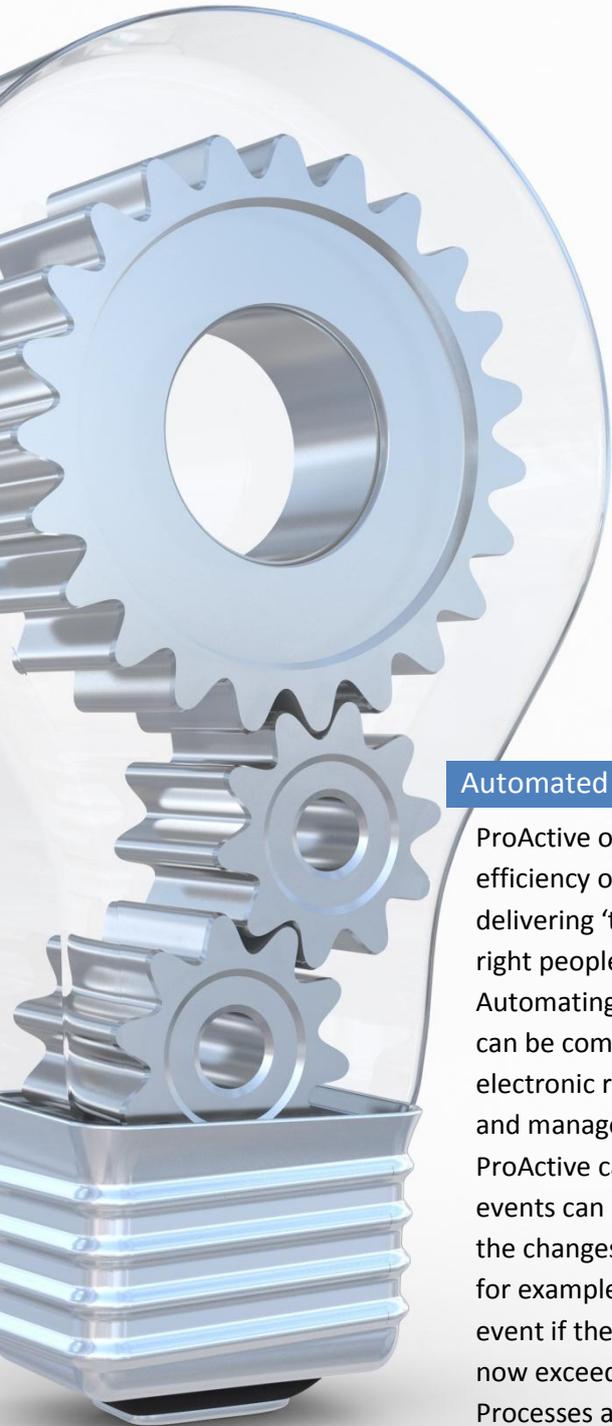

Intelligence

Using intelligent variable led rules allows the enterprise to follow process flows and can act upon captured results and values. Using logic such as 'if', 'then' and 'else' ProActive can action steps in a process depending on parameters monitored or received from the previous step. This powerful workflow process enables the business to add intelligence to common and complex procedures with the benefit of streamlining processes.

Automated

ProActive optimises the efficiency of processes by delivering 'the right work to the right people at the right time'. Automating business processes can be completed through electronic receipt, processing and management of work. ProActive can trigger events and events can be conditioned by the changes that have occurred, for example, only trigger this event if the customer balance now exceeds the credit limit. Processes are automated, secure and streamlined.

Security

Automating processes not only improves efficiencies but also removes the potential for manual input error. ProActive will allow you to build in your own business rules to ensure that any input data outside agreed field parameters will not be accepted. In addition, validation rules and routines for data input can be implemented. ProActive incorporates a virtual terminal which allows you to capture key strokes for automating existing routines.

Your business in action
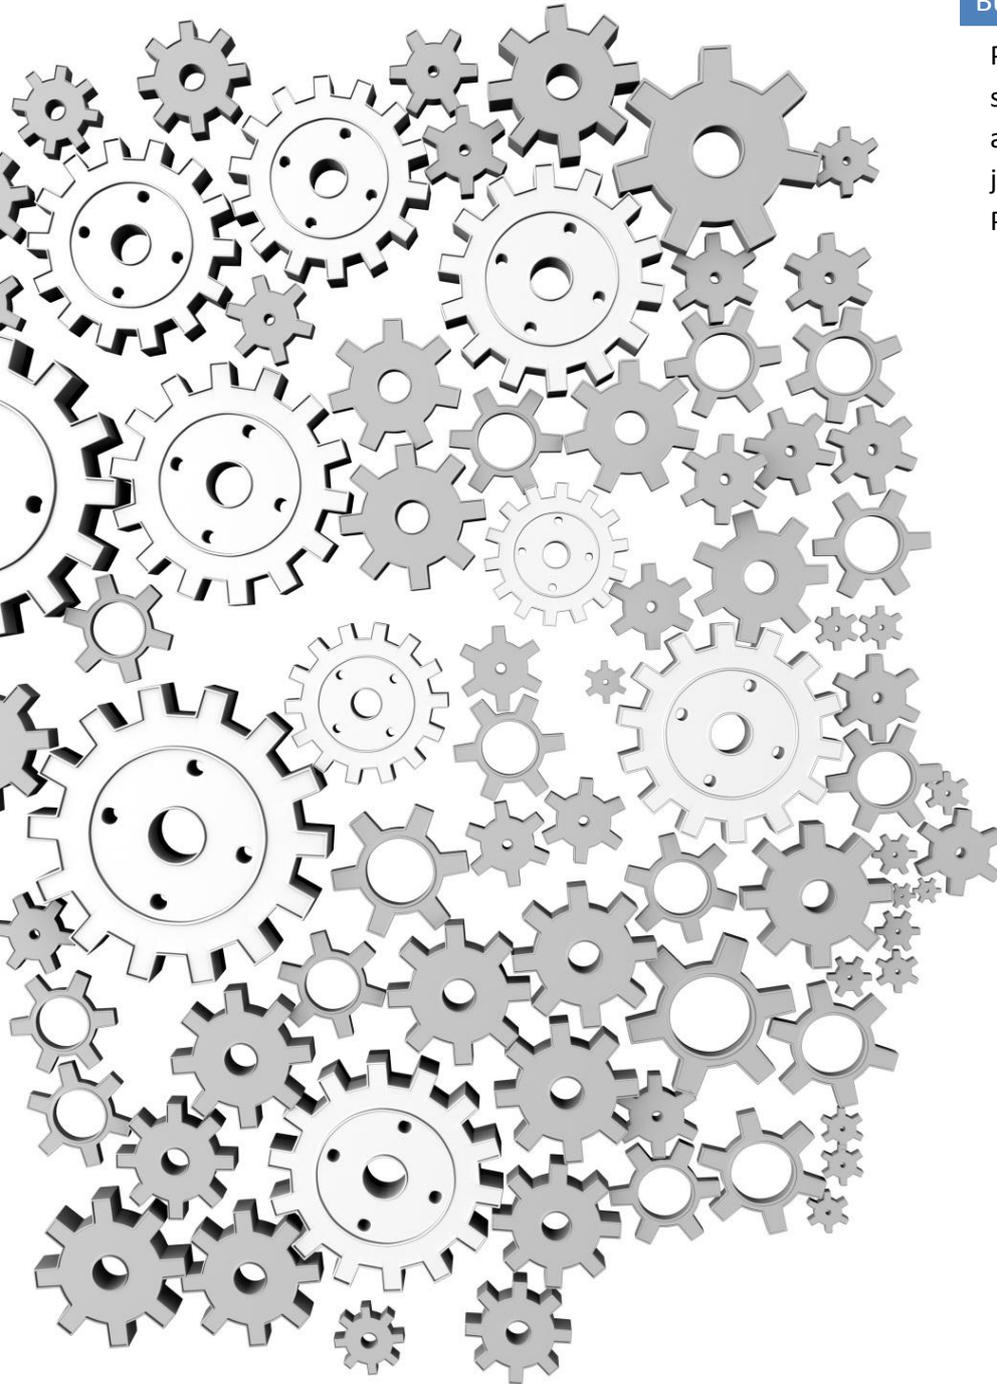

ProActive has been used to streamline and improve many areas of business. Below are just a few examples of where ProActive could be used:

i) Create an audit record of any price changes to orders.
ii) Notify credit control whenever a customer exceeds their credit limit
iii) Send an email or SMS to a customer when their order is despatched
iv) Keep files synchronised in another application
v) Warn purchasing when items in stock are low
vi) Guide through manufacturing procedure using logic based workflow
